I. ABSTRACT

This section provides on overview about the project. It should be completed at the very last stage of the writing, i.e., after you have completed all the other sections.

II. INTRODUCTION

In this section, you need to address the following items:

- The goal of this project
- The rationale of the project
- The importance of the project
- Your main contributions to the project

III. LITERATURE REVIEW

- How, when the problem was raised by whom, what event, etc.
- Any attempts have been proposed to attack the problems
- Pros and Cons of each existing solution
- How does your proposed solution fit within here, i.e., your solution is improving an existing solution, just another solution, or revolutionizing the way of thinking?

Make sure to cite references. Here is how to cite the great textbook written by Knuth [?] in LaTeX. Here is the way to cite a journal article written by the father of computer science Alan Turing [?].

IV. YOUR PROJECT IDEA/DESCRIPTION

In this section, first, we redefine the problem in great detail. Then, describe your solutions. Try to use as many illustrations, such as pictures, graphs, and pseudo-codes, as you see fit. Here are some examples of including pictures, graphs, and pseudo-code in latex.

Figure **??** shows how to include a picture in a Latex document.

Fig. 1. This is my great security design.

Figure **??** is a sample pseudo code copied from this site [?].

Figure **??** is a sample float chart copy from this website [?]

Fig. 2. This is my great pseudocode

Fig. 3. This is my great float chart

A. Mathematics

If your project idea needs mathematics to formulate your methods, LaTeX is great at typesetting mathematics. Let $X_1, X_2, \ldots, X_n$ be a sequence of independent and identically distributed random variables with $E[X_i] = \mu$ and $\text{Var}[X_i] = \sigma^2 < \infty$, and let

$$S_n = \frac{X_1 + X_2 + \cdots + X_n}{n} = \frac{1}{n}\sum_{i}^{n} X_i$$

denote their mean. Then as n approaches infinity, the random variables $\sqrt{n}(S_n - \mu)$ converge in distribution to a normal $\mathcal{N}(0, \sigma^2)$.

V. PROJECT IMPLEMENTATION

In this section, describe details of your project design and implementation, document challenges and obstacles, and how you overcome them in design and implementation.

VI. Testing and Experiments

In this section, describe your testing and experiment design and setup, and conduct the testing and experiments, and generate data.

Need to explain why your experiment design will do what is supposed to do, and describe the expected result, and how the result may validate your ideas and/or support your project.

VII. Data Analysis

Based on the data generated from the testing and experiments, we derived the following results. The global temperature is increasing at an alarming rate as illustrated in Figure **??**. It is not real data, it is for demonstration only.

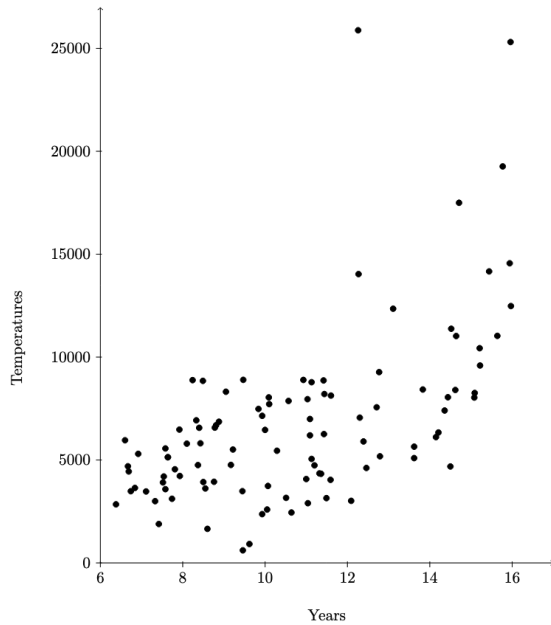

Fig. 4. Recent Global Temperature Data

VIII. Conclusions

In this section, you should provide a concise summary of your work, and state the importance of your idea and your contribution towards solving the problem. Point out any improvement that could be done if you had more time. List some ideas for future work.

IX. Acknowledgment

I thank my advisor for the guidance and I appreciate the financial and emotion support from my family and sponsors, ...

X. Appendices

This includes all source code, scripts, and any material that helps other people replicate the results.
